free profile, join the #CpSteam chat. Effects of different dietary fat content on growth performance and the hepatic gene expression of nutrient-related key enzymes in laying hens. This study was carried out to investigate the effects of dietary fat content on laying hen performance and hepatic gene expression of nutrient-related key enzymes, including the de novo lipogenesis enzymes fatty acid synthase (FAS) and malic enzyme (ME), and the utilization of the dietary fatty acid profile for ATP production by peroxisome proliferator-activated receptor (PPAR) gamma coactivator 1alpha (PGC-1alpha). A total of 144 laying hens (Hy-Line Brown) were divided into 6 dietary treatments, with the following diet compositions: 0, 10, 20, 30, 40, and 50% corn oil (CO) replacement with sunflower oil (SO). Feed consumption and egg production were not affected ($P > 0.05$) by dietary CO replacement. The liver coefficient was increased ($P 0.05$). The gizzard weight decreased ($P 0.05$) by dietary CO replacement. In summary, a high fat diet (50% CO) could increase the liver weight and the mRNA levels of nutrient-related key enzymes, leading to a higher body energy content.

Q: Take over an uninstantiated Class Ok, so I have a class for my main business logic. It is a bit like a state machine (which might be the reason why I don't feel like using StateMachine library). This class is instantiated once and is used by the rest of the code. Now I have 2 questions : - How can I use a callback to monitor the state of the class? Ideally 82157476af
